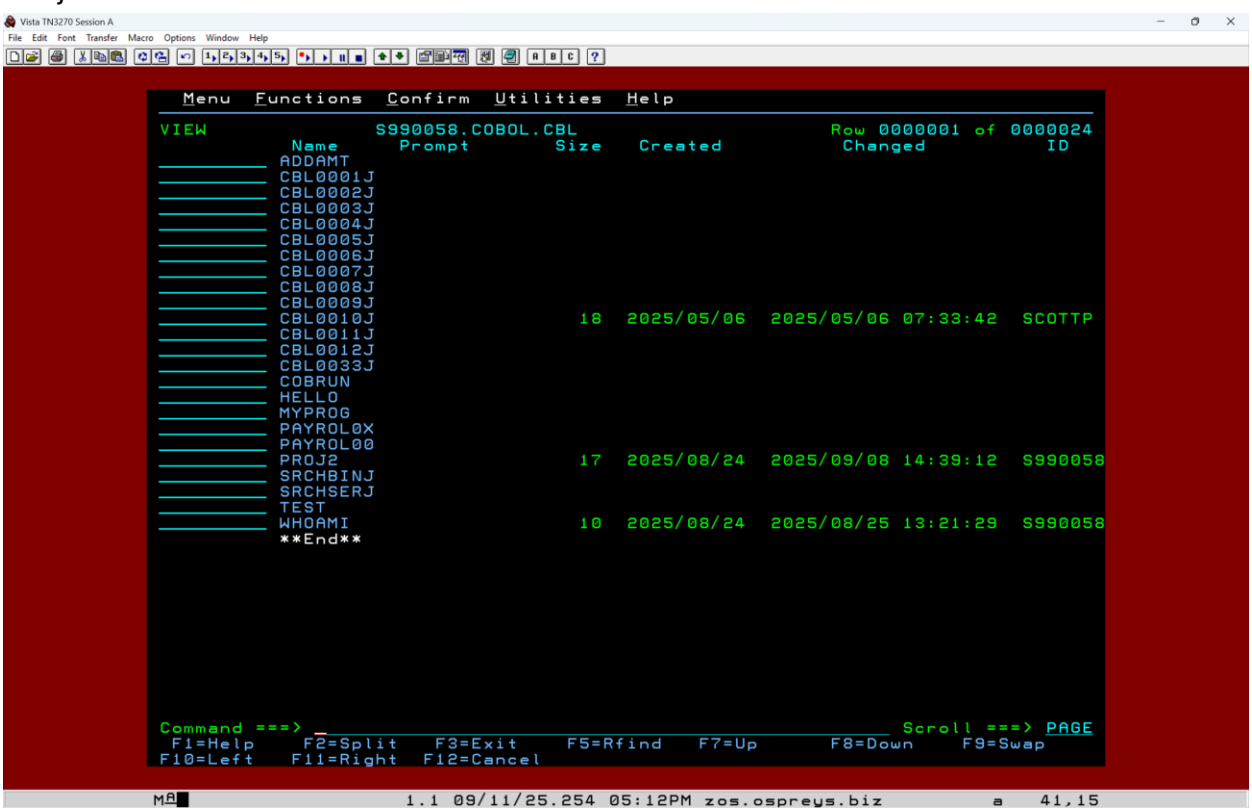
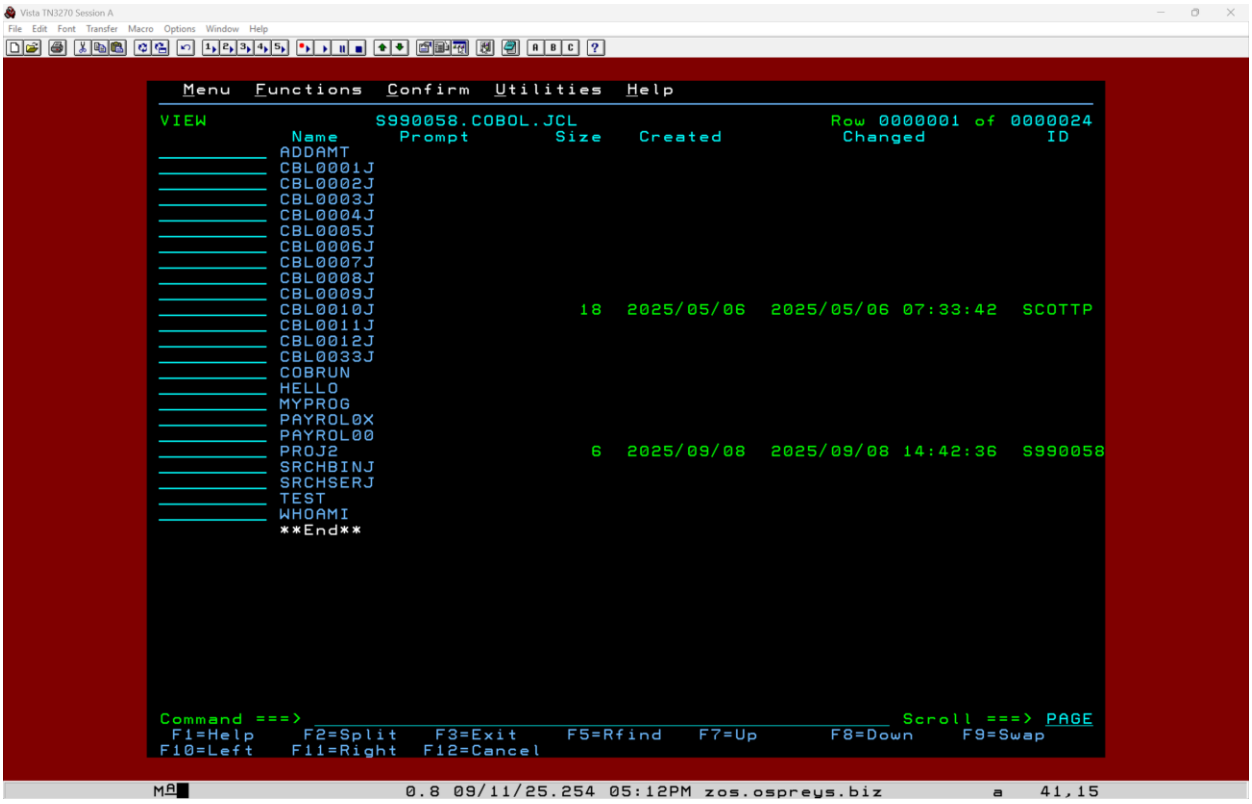
Austin Ellis Project 2 3270, ISPF, COBOL and JCL

Step 1: Copying the WHOAMI COBOL and JCL members using ISPF

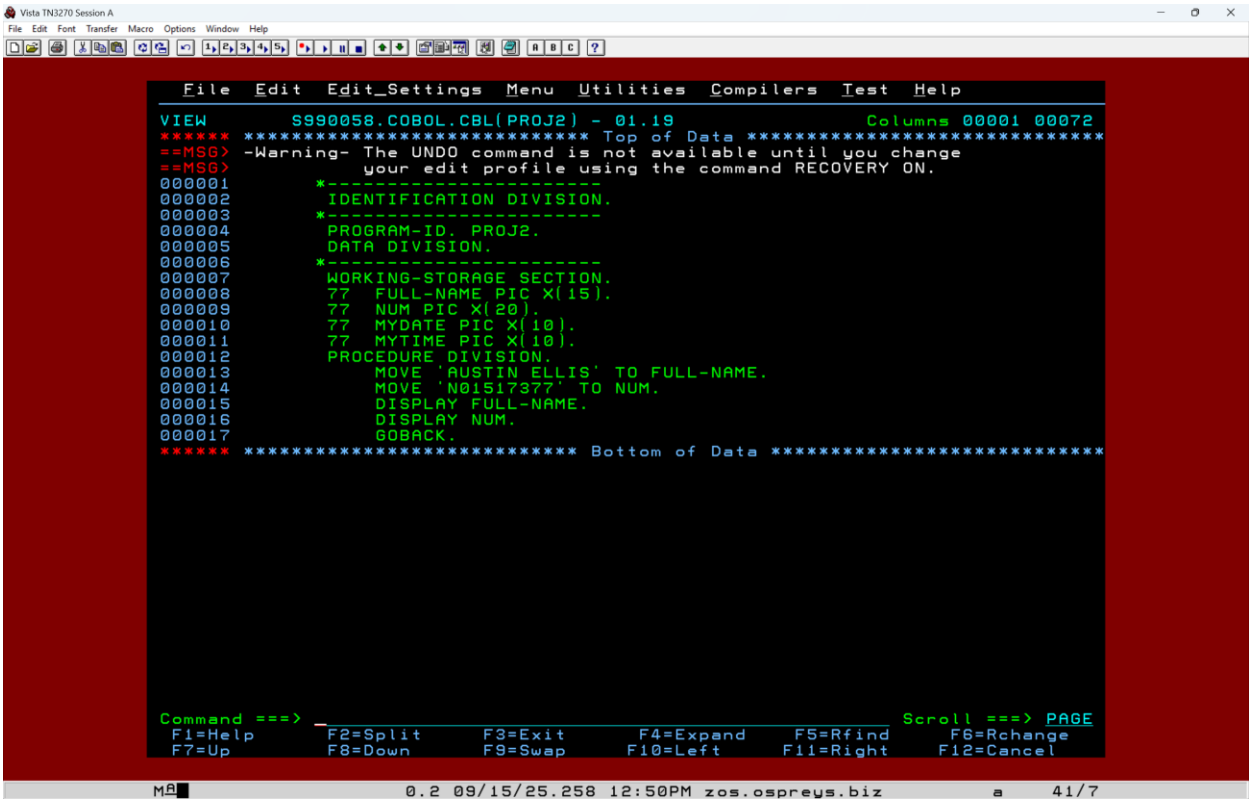
To begin copying both the WHOAMI COBOL and JCL, you must start in the ISPF panel and type 3.3 to initiate a copy. You then type the name of the name of the data set you want to copy. In the WHOAMI you type ‘S990058.COBOL.CBL(WHOAMI)’ and for the JCL you type ‘S990058.COBOL.JCL(WHOAMI)’. Once you type that make sure to type ‘C’ in the command line to copy the dataset. Then it prompts you to name the dataset you want the copied dataset to go into. In this instance we are creating two new datasets one being ‘S990058.COBOL.CBL(PROJ2)’ and ‘S990058.COBOL.JCL(PROJ2)’ for the JCL. That will have not only successfully created the dataset but copied the existing datasets into the new ones specified. The screenshot below contains the new copied dataset members ‘Proj2’ in both the .CBL and the .JCL





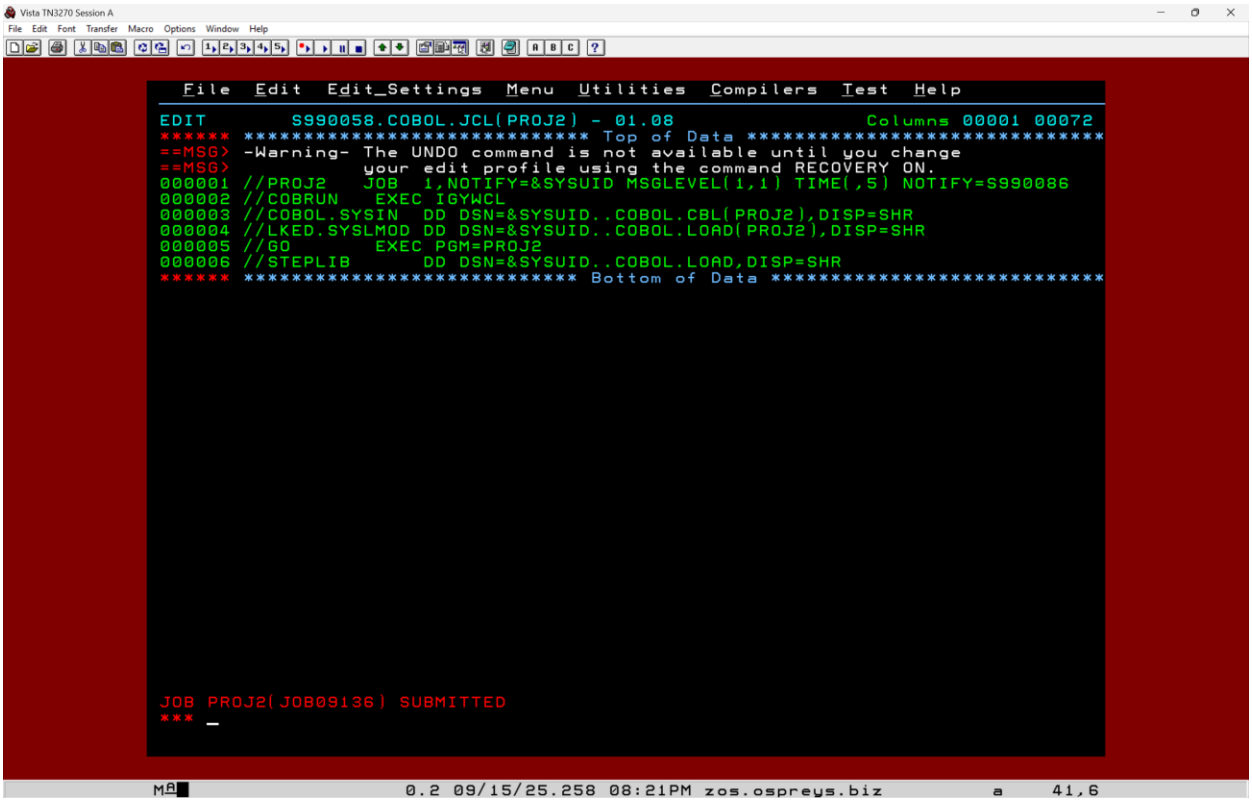
Step 2: Editing the PROJ2 COBOL program and JCL

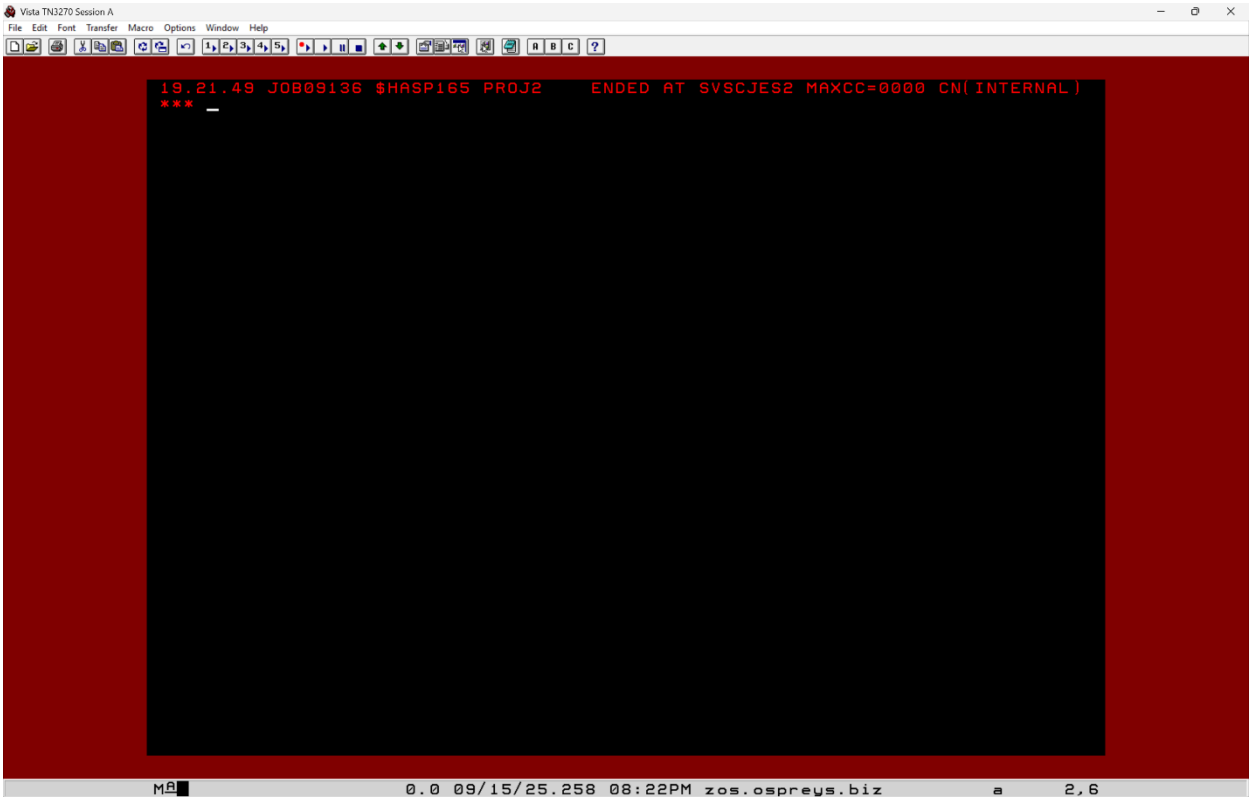
Once we create PROJ2 COBOL program it should be a carbon copy of the WHOAMI COBOL program. We need to edit a few things for it to run according to instructions. First is we change Program ID to PROJ2. Not a super impactful change but may be necessary in certain scenarios. Then we create a section in the Data Division called WORKING-STORAGE SECTION. This section includes the creation of FULL-NAME, NUM, MYDATE, MYTIME. PIC defines the format and characteristics of the data. X(15) means it expects 15 or less characters and same thing with X(20). Normally you wouldn't do X(20) for a number but this NUM data is a student id which contains letters and numbers. The number 77 to the left indicates a independent data item. Within the procedure division instead of displaying a hard coded name we use the move command to say Move "Austin Ellis" to Full-Name. Same goes for NUM.



STEP 3: Compiler Output

Once you have edited the COBOL and JCL properly you should submit the JCL by typing “submit in the command line. This is the result you should expect.





Step 4: Review Detailed Output

Once you submit the job with no errors, navigate to status of jobs by typing SD in the ISPF and the ST after. Type S next to the job you want to review. This should be the detailed output you see.

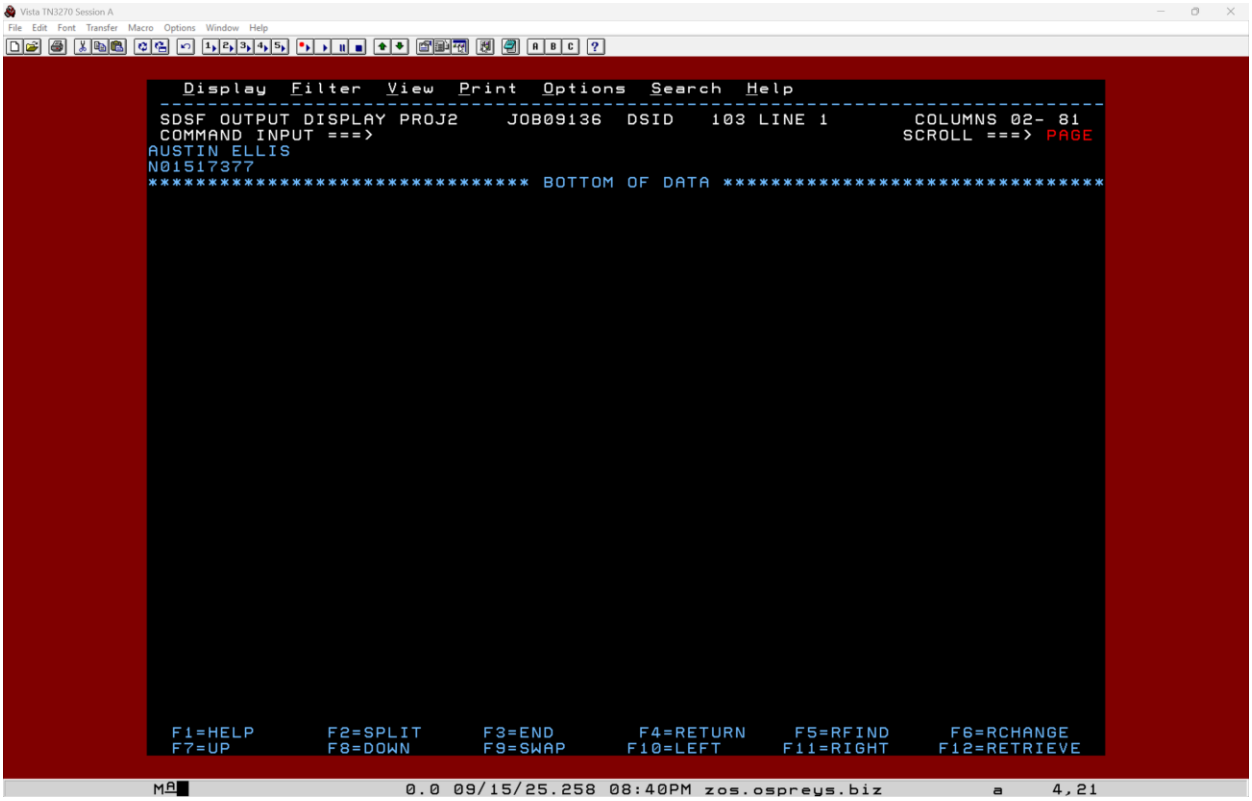
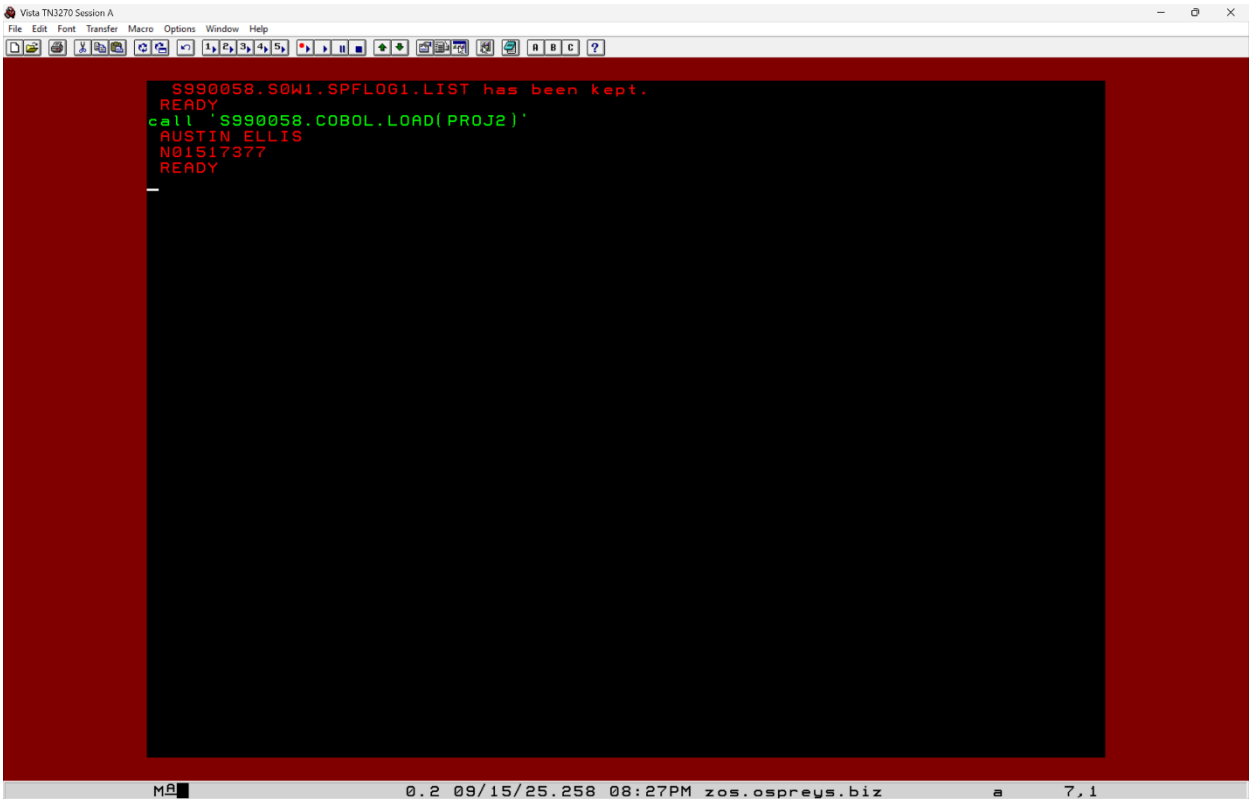
Step 5: Batch Output

Scroll to the very bottom of this detailed output and you will see the output that ran.



Step 6: Interactive run

To navigate to interactive run go to the ISPF and hit F3 to go to the interactive run. Hit 3 and you will be in the interactive run. Once in there type call ‘s990058.cobol.load(proj2)’ and it will run the output below.



Summary: After doing this project I definitely got more experience with JCL. Since this is a whole new COBOL program there needs to be its own JCL and that was challenging to figure out what to change. Also including the MSGLEVEL and NOTIFY was tricky. Designing the COBOL program was tricky regarding formatting but now that I know and understand it I wont forget it.
