
This is me prompting with the numbers I want and it displays the correct output. Then I put incorrect input and the program handles it correctly.

Overall I would say the project was pretty challenging. The most challenging part for me is the error handling. I used documentation for the testval to do error checking. I also for the longest while couldn’t figure out the syntax of the function which was giving me a bunch of errors. I also removed the accept omitted part of the program after talking to a couple of classmates.
